

Alternative Waste Management Strategies

The world produces 490 million tons of garbage per year. Our garbage is put into the ocean, into landfills, or we burn it. This is bad for our planet and our health. So we need to come up with other ways of reducing our garbage.

Product Design

We can use biodegradable material that will breakdown in nature without hurting animals. Also, we should design products that are better quality and that last longer.

Reuse

Reusing material keeps things out of the garbage, and reduces pollution. Also, reusing things saves you money.

Composting

Composting is the breakdown of organic material into soil. This soil can help us we grow healthy plants. If left in the landfills, food waste will release methane gas, which is bad for the environment and contributes to global warming.

Recycling

Recycling processes used materials into new, useful products. You can recycle things like: plastic, paper, aluminium cans, and glass

Reduce

If we don't need something, we should not buy it. If we buy less, then we will throw fewer things away, which will be better for the environment.
